

# Week 8

# Notes:

## UI (User Interface)

VS

## UX (User Experience)

- User interface (UI) is the aspect of overall design and feel of your webpage. With the strategic use of imagery, assets, fonts, colors, spacing etc. You are working towards creating a flavorful, aesthetic design that will please the market/users you are targeting.

- User Experience (UX) is the practical usage of your elements, assets, imagery, links, etc. Which all affect the overall flow and experience of your website. From loading the website, to the buttons you click, to the pages it takes you. The beginning to the end of your audience's experience is dependent on a proper User Experience (UX).
